	Urgent	**Not Urgent**
Important	**Do - (Your MVP)** ● Grab weather data from API ● Predict hourly wind speed given latitude and longitude ● Test for the model's error	**Schedule - (For V2.0+)** ● Create GUI for choosing locations and representing predictions ● Compare predictions with other forecast models ● Choose different regression models
Not Important	**Delegate - (Use a library)** ● Read the historic wind data from the API ● Store large amounts of wind data ● Create a linear regression model based on data	**Delete - (Cut it)** ● Create map for locations with high error in predictions ● Predict temperature and wave height ● Diagnose cause for wind conditions (pressure systems, weather fronts, etc.)
